

## Today's "Menu"

(week 4)

- Announcements
- Decision structures (if-/elif/else)
- Booleans
- A few internet/networking 'tricks'
- How to 'break up' a program using functions
- How to write a program?
- To write a program!
- Questions/Concerns?

24-Feb-10

COMP 480 - Winter 2010

1

## Announcements

- Exam starts this week – Wednesday through Tuesday
- Windows calc has binary (hex/octal) mode
- Question: Best communication mode? Which?
  - E-mail?
  - Class web page?
  - myFranklin announcements?
- "Turing Test of Intelligence" and "[smart birds](#)"

24-Feb-10

COMP 480 - Winter 2010

2

## Misc

### NOTE

```
IDLE 2.6.1
>>> 'hello' * 5
'hellohellohellohellohello'

>>> '77' * 3
'777777'
>>>
```

However

```
>>> 77 * 3
231
```

**PAPERS:** Unless you are expert in the field of AI, your “reasoned” thoughts/opinions will benefit from references to as a basis for your statements/conclusions.

24-Feb-10

COMP 480 - Winter 2010

3

## Functions

- How to break up a program into functions?
- Every 20 lines?

24-Feb-10

COMP 480 - Winter 2010

4

## Functions

- Distinct task (encapsulate **one** task - abstraction)
- Repetitive tasks (code re-use)
- **Test**: Name of method should reflect method.
  - get\_user\_input\_and\_calculates\_total\_plus\_tax\_display\_bill()? Hmpf!
  - Or?
  - get\_user\_Input()
  - calculate\_Tax()
  - calculate\_Total()
  - display\_Bill()

24-Feb-10

COMP 480 - Winter 2010

5

## Global vs. Local Variables

- Local variables are “local” to the body of a function.
- Local variables **exist only within the block** where they are defined, they are **not accessible elsewhere**.
- Global variables are visible everywhere.
- Global variables should be AVOIDED!!
- See section 3.4-3.6 of text and sample program: [loc\\_glob\\_vars.py](#)

24-Feb-10

COMP 480 - Winter 2010

6

## if-Statement (1)

- Allows us to break out of simple sequential execution
- We can make decisions based on user input
- Essential for error handling and algorithmic control

24-Feb-10

COMP 480 - Winter 2010

7

## if-Statement (2)

**if** <Boolean expr is true>:  
 execute “body” of if-statement  
 could one or more statements

also

```

if <Boolean expr>:
    ....
else:
    ....

if <Boolean expr>:
    ....
elif <Boolean expr>:
    ....
elif <Boolean expr>:
    ....
else: # note, no Boolean expr here
    ....
  
```

24-Feb-10

COMP 480 - Winter 2010

8

## Quick Example

```

.
.

number = ???
                                ← always have a blank line before
if number >= 0:
    print 'absolute value of number is ', number
else:
    print 'absolute value of number is ', -number
                                ← always have a blank line after for readability!
.
.
.

```

24-Feb-10

COMP 480 - Winter 2010

9

## Quick Example

```
from random import randint
```

```
op1 = randint(0, 3)
```

```

if op1 == 0:
    print ' + '
elif op1 == 1:
    print ' - '
elif op1 == 2:
    print ' * '
else:
    print ' / '

```

24-Feb-10

COMP 480 - Winter 2010

10

## Boolean Logic

### It's all about Truth

**George Boole** (2 November 1815 – 8 December 1864) was an [English mathematician](#) and [philosopher](#).

As the inventor of Boolean logic, which is the basis of modern digital computer logic, Boole is regarded in hindsight as one of the founders of the field of computer science.

[http://en.wikipedia.org/wiki/George\\_Boole](http://en.wikipedia.org/wiki/George_Boole)

24-Feb-10

COMP 480 - Winter 2010

11

## Boolean AND

- True – if all parts are true
- if smart *and* handsome: # want both

....

Truth Table:

AND	True	False
True		
False		

24-Feb-10

COMP 480 - Winter 2010

12

## Boolean OR

- True – if at least one part is true  
if smart *or* handsome: # will settle for one ☺

....

Truth Table:

OR	True	False
True		
False		

24-Feb-10

COMP 480 - Winter 2010

13

## Compound and Relational Expressions

- Boolean expressions always evaluate to TRUE or FALSE
- Can consist of one or many expressions
- Relational expression use relational operators:  
>, <, <=, >=, !=, ==
- Assignment != Boolean comparison
- Relational expressions yield TRUE or FALSE too
